An inhibition of cyclin-dependent kinases that lengthens, but does not arrest, neuroepithelial cell cycle induces premature neurogenesis. View Article Google Scholar 7.

Thus, Xic1 has distinct roles in cell cycle regulation and differentiation. Cardiomyocytes proliferate in the middle of the heart tube and the inflow tract, but they hardly proliferate in the outflow tract. Skp2 is elevated in a range of tumours [3856], where our data indicate it may play a separable but complementary role in regulating cell cycle progression and differentiation. Cell – Journal of the American Chemical Society 5 Importantly, several transcription factors that promote differentiation of muscle cells, neurons, or blood cells also control expression of cell cycle genes. Even after the provision of cardiomyocytes ceases, the heart continues to enlarge during heart maturation.
