We now have better procedures and more evidence for sound treatment practice. Very recent findings suggest that surgical reintervention to correct pulmonary insufficiency with a valvular prosthesis and tricuspid insufficiency by annuloplasty decreases the incidence of atrial and ventricular arrhythmias, especially if surgical repair is accompanied by ablation of the reentry circuit.

Second natural history study of congenital heart defects: results of treatment
Insufficiency of the tricuspid valve, which is located on the systemic ventricle, can appear after surgical atrial correction, but it is infrequent in the absence of severe right ventricular dysfunction. In babies with atrial septal defects, the septum—the wall that separates the upper chambers of the heart—does not develop correctly.

Madrid: Universidad Aut?? Management of atrial flutter after the Fontan procedure
a relatively high incidence of stenosis or occlusion of main coronary arteries has been detected even in patients who survive the intervention with no apparent perioperative

complications.
